HAFIZ ARSLAN SHAFIQUE

Data Analyst | SQL Analyst | Power BI Developer

Al Mahd, Saudi Arabia | +966 579594038 | hafizarslan3195@gmail.com

LinkedIn: linkedin.com/in/hafiz-arslan-shafique-bc240203664 | GitHub: github.com/Hafiz-Arslan-Shafique | Open to relocation

PROFESSIONAL SUMMARY

Data Analyst with end-to-end analytics experience (185K+ records analyzed across multiple domains) using Advanced Excel, Microsoft SQL Server, T-SQL, and Power BI (DAX, Power Query), plus current experience as Operations Planner and Reporting Analyst on the Ma'aden project, Saudi Arabia. Skilled in ETL, data modeling, data cleaning, KPI reporting, root cause analysis, and interactive dashboards. Proficient in Azure SQL Database for cloud-based reporting.

TECHNICAL SKILLS

Databases & SQL: Microsoft SQL Server, Azure SQL Database, Azure SQL DB, T-SQL, SSMS, CTEs, Window Functions (RANK, ROW_NUMBER, PARTITION BY), Views, JOINs, UNION ALL, Stored Procedures, Aggregations

Business Intelligence: Power BI, DAX, Power Query, Interactive Dashboards, KPI Reporting, Data Visualization, SQL Server to Power BI Integration

Advanced Excel: PivotTables, Power Query, Advanced Formulas, Data Validation, Data Cleaning, Automated Reporting

Data & Analytics: ETL, Data Modeling, Data Profiling, Deduplication, Variance Analysis, Profitability Analysis, Churn Analysis, Root Cause Analysis

PROFESSIONAL EXPERIENCE

Operations Planner | Reporting Analyst — ESOM (El-Seif Operations & Maintenance), Ma'aden Project Jan 2026 – Present

- Prepare weekly and monthly **KPI** performance reports on technician tasks (repairs, replacements) across multiple facilities using **Advanced Excel** (PivotTables, Power Query) and **Power BI**.
- Analyze material usage and shortage trends and build KPI reports that support forecasting of asset and material requirements.
- Develop data-informed renovation plans for damaged facilities to improve operational efficiency.

Backend Developer Intern (Python, Django) — Enigmatix Software House Oct 2024 – Feb 2025

- Built a Django e-commerce project (product management, cart workflow, admin dashboard); tested and documented code.

DATA ANALYTICS PROJECTS (SQL SERVER | POWER BI | EXCEL)

National Infrastructure Budget Variance & Overrun Analysis (59.5K rows) *GitHub: construction-infrastructure-cost-overrun-analysis-sql-powerbi*

- **Problem:** Large infrastructure programs lose funding silently when overruns across regions, contractors, and project types are caught late; leadership could not tell which of 5,000 projects needed intervention first.
- **Solution:** Created a risk-ranked view of all 5,000 projects (High/Medium/Low) and traced overruns to their causes by region, contractor, and cost category, so leadership can act early on the projects and cost drivers that matter most (SQL Server, Power BI).
- **Insight & value:** Program ran **30.10% over budget** (371.23B SAR planned vs 482.97B SAR actual); recurring drivers such as material price escalation point to procurement and scope-control fixes, so managers can review the highest-risk projects first.

Global Superstore Profitability & Returns Root Cause Analysis (52K+ rows) *GitHub: global-superstore-profitability-analysis-sql-powerbi*

- **Problem:** In this retail case study, an 11.63% margin on $12.64M sales looked acceptable, but leadership could not see where profit was leaking or why.
- **Solution:** Traced the margin to its source by product sub-category, region, discount level, and returns, giving leadership one trusted view of where profit is lost and which lever to pull (SQL Server, Power BI).
- **Insight & value:** Tables lose **8.41% margin** under ~29% average discounts, Southeast Asia earns only 2.05%, and returns run 12.18%; this supports a discount-policy and regional pricing review.

Healthcare Operations & Revenue Analytics (55,501 rows) *GitHub: healthcare-operations-analysis-sql-powerbi*

- **Problem:** Hospital leaders could not trust revenue, patient volume, or length-of-stay reports because raw data held duplicate visits, missing dates, and negative bills.
- **Solution:** Created one validated, duplicate-free reporting layer so operations leaders can rely on revenue, patient volume, and length-of-stay figures and track stay against target (SQL Server, Power BI).
- **Insight & value:** Cleaning 55,501 raw rows into 49,986 valid patients gave a trusted baseline: average stay of 15.50 vs 15.00 days target and revenue spread evenly across conditions, so cost control should target discharge process and hospital efficiency, not one diagnosis.

Also on GitHub: Bank Churn (20.38% churn; Germany 32.4%), Telecom Churn (26.54% churn), Mobile Sales ($264.82M revenue).

EDUCATION & CERTIFICATIONS

BS Software Engineering — Virtual University of Pakistan (in progress, CGPA 3.15) Languages: English, Urdu, Punjabi

Advanced Excel & Power Query Mastery (2026) | Power BI: Data Visualization & DAX (2026) | Python Backend Development (2025)
